

CORBIN CHP-1 Hydro Press

Breather Cap Installation

The CHP-1 Hydro Press is shipped with hydraulic fluid installed. The breather cap which screws into a port on top of the hydraulic tank within the press cabinet has been removed for transportation and is found in a package on top of the press control panel. *Before operating the press, you must remove the front panel (six screws secure it), locate and remove the plug which prevents spilling fluid if the press is tipped during transportation, and screw in the breather cap. Here are the steps:*

1. Locate the breather cap, shipped in a package on top of the press.

2. Remove the six screws holding the front panel on the press.

3. Locate and unscrew the threaded plug which is screwed into the breather port, and replace it with the breather cap. Screw it in by hand.

(Do not use pliers or a wrench on the cap. Just screw it firmly in by hand.)

4. Replace the front panel with the six screws holding it to the frame.
